The University of Michigan is doing a study using a program developed by the National Institutes of Health on the iPad to better detect signs of memory and thinking difficulties that may predict the development of additional problems as we get older.

**What is involved?**

- Yearly University of Michigan-Memory and Aging Project (UM-MAP) visit that includes a neurological and physical exam and memory screening.
- The ARMADA Project visit includes using an iPad for memory screening. Participants need to come back once a year.

Participants will receive a payment in the form of a check or gift card for the time and effort they gave for study participation.
